

Title	payment-invoices: invoice waits full timeout (5-10h) when no crypto deposit is detected
Severity	Critical
Priority	High
Status	Open
Environment	prod / payment-invoices

Description

Problem

When a crypto invoice is in `AwaitingCryptoDeposit` and no blockchain transaction is ever detected, the invoice waits until the full `expires_at` timeout (5-10+ hours depending on network). The widget shows "awaiting payment" for the entire duration — poor UX for cases where the customer simply never sent crypto.

Steps to Reproduce

#	Step
1	Create a crypto invoice and navigate to the payment widget.
2	Observe the state <code>AwaitingCryptoDeposit</code> .
3	Do not send any crypto deposit and wait for the deposit detection window (e.g., 15 min) to pass.
4	Observe that the invoice does not expire early and continues waiting until <code>expires_at</code> .

Actual Result

The invoice waits until the full `expires_at` timeout (5-10+ hours depending on network). `Step_02` polls oracle-pool every ~2 minutes, gets "Transaction still not found" each time. Widget shows "awaiting payment" indefinitely.

Screenshot: <https://prnt.sc/ST4eY-Q2waqM>

Expected Result

Two-tier timeout for crypto invoices:

1. **Deposit detection window** (`payment_timeout` + `confirmation_timeout`, default 15 min): if oracle-pool hasn't detected any transaction within this window, expire the invoice early. During this window the invoice is cancellable.

2. **Full expiry** (`expires_at`): only applies once a transaction has been found. At that point we're waiting for confirmations/processing, and the full timeout is justified.

Additional Information

Evidence:

Order 019df89c-74c0-7953-a02d-7839ee3eeeee7, invoice 019df8b5-c956-78f2-abe7-e4f2c6234e4e (2026-05-05): created at 15:15 UTC, `expires_at` 20:30 UTC (5h15m window). User never sent crypto.

Solution:

All invoice timeouts extracted into configurable `InvoiceTimeoutConfig` (env vars with transitional defaults). Early expiry added to the process loop: if `AwaitingCryptoDeposit` and past the detection window with no tx detected, expire early. In-flight tx guard prevents expiry if oracle has found a transaction. Oracle pool subscription is now unsubscribed on any expiry (not just cancel).
